Potentiometer Input Alarm Trips, Adjustable Setpoints

Input: 100 Ω to 1 MΩ Potentiometer
Outputs: One DPDT Relay or Two SPDT Relays

- Accepts Wide Range of Potentiometers
- Calibration Unaffected by Potentiometer Value
- High Capacity 7 Amp Relay Contacts
- Input LoopTracker® & Alarm Status LEDs
- Alarm Test/Reset Pushbutton

Applications
- Process Limit Backup Alarm
- Valve Out-Of-Range Alarm
- Over, Under, Out-Of-Range Position Monitoring

Specifications

Potentiometer Range
Minimum: 0-100 Ω
Maximum: 0-1.0 MΩ (1,000,000 Ω)
Full travel of the potentiometer is required
Consult factory for other ranges and configurations

Input Impedance
10 MΩ minimum

Input Protection, Common Mode
750 VDC or 750 VACp
System voltages must not exceed socket voltage rating

LoopTracker
Variable brightness LED indicates input level and status

Relay Output
Factory Configured—See Options for other relay configurations

API 1800 G
One DPDT contact set
HI alarm, normal action (failsafe), non-latching standard
7 A @ 240 VAC maximum resistive load
3.5 A @ 240 VAC maximum inductive load

API 1820 G
Two SPDT contacts
HI/LO, normal action (failsafe), non-latching standard
7 A @ 240 VAC maximum resistive load
3.5 A @ 240 VAC maximum inductive load

CAUTION:
Socket contacts may limit system rating.
External contact protection such as an RC snubber is recommended for inductive loads.

Alarm Setpoint
12 turn potentiometer, field adjustable from 0 to 100% of span

Deadband
API 1800 G 1.0 to 100% of span, 12 turn potentiometer
API 1820 G Fixed at 1% of span, standard
API 1820 GA 1.0 to 100% of span, 1 turn potentiometer

Functional Test/Reset Button
Toggle relay(s) to opposite state when pressed
 Resets latching relay on 1800 G with HT option

Response Time
70 milliseconds typical

Ambient Temperature Range
−10°C to +60°C operating ambient

Temperature Stability
Better than ±0.02% of span per °C temperature stability

Power
Standard: 115 VAC ±10%, 50/60 Hz, 2.5 W max.
A230 option: 230 VAC ±10%, 50/60 Hz, 2.5 W max.
D option: 9-30 VDC, 2.5 W typical

Descriptions and Features

The API 1800 G and API 1820 G are factory configured for a potentiometer (slidewire) input and provide alarm contact outputs. Heavy-duty relay contacts allow the module to directly control high capacity loads.

Potentiometers with a value of 100 Ω through 1.0 MΩ can be connected without recalibration and without affecting accuracy as long as 100% of the potentiometer is being utilized in the application. Consult factory for assistance with special models with offsets or input ranges using other than the full range of the potentiometer.

API exclusive features include a LoopTracker LED that varies in intensity with changes in the process signal, alarm status LEDs for each alarm, and a Functional Test Pushbutton to toggle the relays independent of the input.

The API 1800 G provides a single setpoint adjustment and DPDT relay contacts. The alarm output can be factory configured for HI or LO operation, non-latching or latching, normal (fail-safe) or reverse (non-fail-safe) acting.

The API 1820 G contains two independent setpoints with two SPDT relay contact outputs. The alarm output can be factory configured for HI/Hi, HI/LO, LO/HI or LO/LO operation, normal acting (fail-safe) or reverse acting (non-fail-safe).

Models & Options

Factory Configured—Please specify if non-standard input

API 1800 G Potentiometer input alarm trip, 1 DPDT relay, HI alarm, normal action (failsafe), non-latching, 115 VAC
API 1820 G Potentiometer input dual alarm trip, 2 SPDT relays, HI/LO alarms, normal action (failsafe), non-latching, 115 VAC

Options—Add to end of model number
A230 Powered by 230 VAC, 50/60 Hz
D Powered by 9-30 VDC
R Reverse-acting alarms (non-failsafe)
L Low trip (on decreasing signal) for 1800 G
HT Latching alarm with pushbutton reset. API 1800 G only
HP Latching alarm with power-off reset, API 1800 G only
H Adjustable deadbands for 1820 G
HH High/High trip for 1820 G instead of High/Low
LL Low/Low trip for 1820 G instead of High/Low
U Conformal coating for moisture resistance

Accessories—Order as a separate line item
API 011 11-pin socket
API 011 FS 11-pin finger safe socket
API TK36 DIN rail, 35 mm W x 39” L, aluminum
**Installation and Setup**

**ELECTRICAL CONNECTIONS**

**WARNING!** All wiring must be performed by qualified personnel only. This module requires an industry-standard 11-pin socket. Order API 011 or finger-safe API 011 FS socket separately.

- **Power Input Terminals** – The white label on the side of the API module will indicate the power requirements. AC power is connected to terminals 1 and 3. For DC powered modules, polarity MUST be observed. Positive (+) is wired to terminal 1 and negative (-) is wired to terminal 3.

- **Signal Input** – Refer to the wiring diagram below to connect the potentiometer input. Any value potentiometer can be used as long as its full range is used.

**Potentiometer**

**Relay Output Terminals** – Terminals 6, 7, 8 and 9, 10, 11 provide the appropriate connections for the desired relay operations. (NO = Normally Open, NC = Normally Closed, C = Common). NOTE: Although the API 1800 G has a pair of relays, these relays will energize and de-energize in unison. The API 1820 G will accommodate independent relay operations.

**SETUP**

The input range and alarm types are pre-configured at the factory as specified on your order. No input calibration is necessary. Contact factory for custom ranges or modifications.

- **Setpoint Control** – This multi-turn potentiometer (one for each setpoint on the API 1820 G) allows the operator to adjust the level at which the alarm is activated. This control is adjustable from 0 to 100% of the input range.

- **Deadband Control** – The API 1800 G deadband potentiometer allows the alarm trip and reset window to be adjusted symmetrically about the setpoint from 1 to 100% of the span.

The deadband is fixed at 1% of span on the API 1820 G. The API 1820 G GA with adjustable deadband option allows deadbands to be adjusted symmetrically about each setpoint from 1 to 100% of the span.

Adjustable deadband allows the operator to fine tune the point at which the alarm trips (alarm condition) and resets (non-alarm condition). The deadband is typically used to prevent chattering of the relays or false trips when the process signal is unstable or changes rapidly.

**API 1820 G Alarm Configuration** – The alarm configuration of the API 1820 G is pre-configured at the factory per your order, but if a change is necessary, internal jumpers can be used to modify the alarm type as follows.

1. Unplug the module from the socket.
2. Remove the 4 screws from the module bottom and remove the plastic case.
3. Unplug the circuit board with the test button from the base.
4. Note location of jumper block at top left of circuit board next to test button.
5. Place jumpers as indicated for desired alarm operation. The standard HI/LO setting is with one jumper across the two top pins or with no jumper at all. Never place a jumper across the two bottom pins!
6. Replace board, cover, and screws.

**POWER INPUT**

- **Setpoint 1 = HI**
- **Setpoint 2 = LO**

- **Setpoint 1 = LO**
- **Setpoint 2 = HI**

**TEST BUTTON**

The functional test pushbutton toggles the alarm status independent of the input when depressed. It verifies the alarm and system operation and also provides the additional function of unlatching the alarm on the API 1800 GHT with the latching alarm option.

**OPERATION**

- **GREEN LoopTracker® Input LED** – Provides a visual indication that a signal is being sensed by the input circuitry of the module. It also indicates the input signal strength by changing in intensity as the process changes from minimum to maximum to provide a quick visual picture of your process loop at all times. If the LED fails to illuminate, or fails to change in intensity as the process changes, this may indicate a problem with module power or signal input wiring. This feature greatly aids in saving time during initial start-up or troubleshooting.

- **Bi-Color Alarm LED** – Provides a visual indication of the alarm status. In all configurations, a GREEN LED indicates a non-alarm condition and a RED LED indicates an alarm condition.

**Alarm Relays** – In the normal mode of operation (failsafe), the relay coil is energized in a non-alarm condition and de-energized in an alarm condition. This will create an alarm condition if the module loses power. For a normal acting, non-latching configuration, the alarm will activate when the input signal exceeds the setpoint (HI alarm) or falls below the setpoint (LO alarm), then will automatically reset when the alarm condition no longer exists.

If reverse acting mode is selected (non-failsafe), the relay coil is de-energized in a non-alarm condition and energized in an alarm condition. The alarm will activate when the input signal exceeds the setpoint (HI alarm) or falls below the setpoint (LO alarm), then will automatically reset when the alarm condition no longer exists.

**API 1800 G HT Latching Alarm** – For units with the HT latching alarm option, the Test Switch is also used to reset the alarm relays. The alarm relay contacts will remain in the alarmed condition until the input signal falls below the high alarm setpoint (or above low alarm setpoint, depending on configuration) and the Test/Reset pushbutton has been pressed or power to the unit has been switched off.

**API 1800 G HP Latching Alarm** – For units with the HP latching alarm option, the alarm relay contacts will remain in the alarmed condition until the input signal falls below the high alarm setpoint (or above low alarm setpoint, depending on configuration) and the power to the unit has been switched off.
