Input: mVDC, ±10 to 0-10 VDC, 0-1 mA to 4-20 mA
2 Outputs: mVDC, ±10 to 0-10 VDC, 0-1 mA to 4-20 mA

- One Input Dual Output Signal Splitter
- 2000 V Power/Input/Output/Channel Isolation
- Full Isolation Eliminates Ground Loops
- Input and Output LoopTracker® LEDs
- Functional Test Pushbutton for Each Channel
- Independent Zero and Span for Each Channel

Specifications

Input and Output Ranges
Factory Configured—Please specify range
Consult factory for special ranges
Voltage: 0-50 mVDC, 0-100 mVDC, 0-5 VDC, 0-10 VDC
Bipolar Voltage: ±5 VDC, ±10 VDC
Current: 0-1 mA, 0-20 mA, 4-20 mA (1000 Ω maximum per channel)
Sinking input and sourced outputs for current

Input Voltage Burden (Current)
1.25 VDC maximum

Output Linearity
Better than ±0.1% of span

Output Ripple and Noise
Less than 10 mVRMS

Output Zero and Span
Multi-turn zero and span potentiometers to compensate for load and lead variations
Independent zero and span potentiometers for each output channel
±15% of span adjustment range typical
Low interaction zero/span: <0.001 ppt

LoopTracker
Variable brightness LEDs indicate input/output loop level and status

Functional Test Buttons
Sets output to test level when pressed. One per output channel.
Factory set to drive output to approximately 50% of span

Response Time
70 milliseconds typical. Consult factory for other response times.

Isolation
2000 V_RMS minimum
Full isolation: power to channel, input to output, channel to channel

Common Mode Rejection
120 dB minimum

Ambient Temperature Range
-10°C to +60°C operating ambient

Temperature Stability
Better than ±0.04% of span per °C

Case Material
Polycarbonate: gray UL #94V-1 housing and black UL #94V-2 terminals

Power Supplies
Input power supply fuse protected and fully isolated
Standard: 115 VAC ±10%, 50/60 Hz, 5 W max., linear type
A230 option: 230 VAC ±10%, 50/60 Hz, 5 W max., linear type
DD option: 9-30 VAC/VDC, 5 W typical, switching type

Applications
- Isolate, Split, Rescale Process Signals
- Send One Process Signal to Two Locations
- Interface Panel Meters, Recorders, Data Acquisition, PLCs, DCS Systems, SCADA Systems

Description and Features

The API 4393 DIN IsoSplitter accepts one analog DC voltage or current input and provides two optically isolated analog DC outputs that are linearly related to the inputs. The input signal is filtered, amplified, split, and then passed through an opto-coupler to the output stage. The two isolated output channels provide an economical solution where more than one output device is connected to the same input signal.

Typical applications include isolation, output splitting, output device separation and redundancy (i.e. to prevent failure of the entire loop if one device fails), or a combination of the three. The optical isolation between the input and outputs make this module useful for ground loop elimination, common mode signal rejection or noise pickup reduction.

This product is designed to function effectively in electrically noisy industrial environments. It is designed to interface with and provide signal compatibility with recorders, data loggers, computers programmable logic controllers, and process transmitters.

API exclusive features include two LoopTracker LEDs and Functional Test Pushbuttons for each channel. The LoopTracker LEDs (Green for input, Red for output) vary in intensity with changes in the process input and output signals and can provide a quick visual picture of your process loop at all times. The functional test pushbutton provides a fixed output (independent of the input) when held depressed. This output is factory set to approximately 50% of the output span. Both the LoopTracker LEDs and functional test pushbutton greatly aid in saving time during initial startup and/or troubleshooting. The modules clip to an industry standard 35 mm DIN rail or they can be surface mounted.

Models & Options

Factory Configured—Please specify input/output ranges and options
API 4393 DIN IsoSplitter, 115 VAC powered
API 4393 DIN A230 IsoSplitter, 230 VAC powered
API 4393 DD IsoSplitter, 9-30 VAC/VDC powered

See API 4393 L1 data sheet for more sink/source versions

Options—Add to end of model number
DF Fast response time, consult factory
U Conformal coating for moisture resistance

Accessories—Order as separate line item
API TK36 DIN rail, 35 mm W x 39" L, aluminum

Discontinued see APD 4930 or APD 4393

DC to DC Signal Splitter, Isolated
API 4393 DIN IsoSplitter®

Removable Plugs for Easy Hookup

Specifications

Input and Output Ranges

Input & Output Calibration!
API 4393 DIN IsoSplitter® Installation and Setup

**TYPICAL APPLICATION**

The API 4393 DIN IsoSplitter is useful where a 4-20 mA signal must be independently output to two devices. The output from a pressure transmitter needs to be monitored in two separate locations. The DCS is used for the control system and another device is used for data acquisition. The API 4393 DIN IsoSplitter provides two independent 4-20 mA loops from one input and provides isolation for each loop.

**POWER INPUT TERMINALS**

The positive connection (+) is applied to terminal 9 and the negative (–) is applied to terminal 10.

**SIGNAL INPUT TERMINALS**

The positive connection (+) for channel 1 is connected to terminal 6 and the negative (–) is connected to terminal 12.

The positive connection (+) for channel 2 is connected to terminal 8 and the negative (–) is connected to terminal 13. For DC-powered versions positive (+) is connected to terminal 9 and negative (–) is connected to terminal 10.

**CALIBRATION**

Front-mounted zero and span potentiometers for each channel can be used to compensate for load and lead variations.

1. Apply power to the module and allow a minimum 30 minute warm up time.
2. Using an accurate calibration source, provide an input to the module equal to the minimum input required for the application.
3. Using an accurate measurement device for the output, adjust the zero potentiometer for the exact minimum output desired. The zero control should only be adjusted when the input signal is at its minimum. This will produce the corresponding minimum output signal. Example: for 4-20 mA output, the zero control will provide adjustment for the 4 mA or low end of the signal.
4. Set the input at maximum, and then adjust the span pot for the exact maximum output desired. The span control should only be adjusted when the input signal is at its maximum. This will produce the corresponding maximum output signal. Example: for 4-20 mA output, the span control will provide adjustment for the 20 mA or high end of the signal.
5. Repeat adjustments for maximum accuracy.
6. Repeat adjustments for second channel.

**TEST BUTTONS**

The test pushbuttons are factory set to provide approximately 50% output. When depressed they will drive the output side of the loop with a known good signal that can be used as a diagnostic aid during initial start-up or troubleshooting. When released, the output will return to normal.

**OPERATION**

**GREEN LoopTracker** Input LED – Provides a visual indication that a signal is being sensed by the input circuitry of the module. It also indicates the input signal strength by changing in intensity as the process changes from minimum to maximum. If the LED fails to illuminate, or fails to change in intensity as the process changes, check the module power or signal input wiring. Note that it may be difficult to see the LEDs under bright lighting conditions.

**RED LoopTracker** output LED – Provides a visual indication that the output signal is functioning. It becomes brighter as the input and the corresponding output change from minimum to maximum. For current outputs, the red LED will only light if the output loop current path is complete. For either current or voltage outputs, failure to illuminate or a failure to change in intensity as the process changes may indicate a problem with the module power or signal output wiring.
