**DuoPak® Two Channel Signal Converter/Isolator/Transmitter, Factory Ranged**

**APD 2007**

---

**Channel 1: DC to DC**

- Two Independent Channels with Full Isolation
- Zero and Span for Each Output
- Input and Output LoopTracker® LEDs
- Output Test/Manual Override for Each Channel
- Built-In I/O Power Supplies

**Applications**
- Monitor a DC Signal and Speed
- Convert/Isolate Dual Output Transmitters

**Channel 1 DC Input Range**

Factory configured, please specify input type and range
- Voltage: 0-10 VDC to 0-100 VDC
- Bipolar voltage: ±50 mVDC to ±10 VDC
- Current: 0-1 mA to 0-50 mA, 4-20 mA
- Voltage input impedance: 200 kΩ minimum
- Current input impedance: 50 kΩ typical
- Input com. mode rejection: 120 dB minimum
- Current input voltage burden: 1.25 VDC max. at 20 mA
- Input loop power supply: 15 VDC, ±10%, regulated, 25 mA, may be connected for sinking or sourcing mA input

**Channel 2 Frequency Input Range**

Factory configured, please specify range
- Frequency: 0-25 Hz to 0-20 kHz
- Any waveform with 5 microsecond min. pulse, 100 mV min. amplitude, 100 mV to 150 Vrms amplitude

**Channel 2 Sensor Power Supply**

15 VDC ±10%, regulated, 25 mA, <10 mVrms max. ripple

**Channel 2 Characteristics**

- Impedance at max. sensitivity: 10 kΩ nom.
- Impedance at min. sensitivity: 100 kΩ nom.
- Sensitivity/hysteresis adjustment: Multi-turn potentiometer
- Sensitivity/hysteresis range: ±25 mV to ±2.5 V typical
- Normal mode protection: 200% of input rating
- Common mode protection: 600 V input to ground

**LoopTracker**

Variable brightness LEDs indicate I/O levels for each channel

**Channel 1 and Channel 2 Output Ranges**

Factory configured, please specify for each output channel
- Voltage: 0-1 VDC to 0-10 VDC, 10 mA max
- Bipolar voltage: ±1 VDC to ±10 VDC
- Current: 0-1 mA to 0-20 mA, 4-20 mA
- 20 V compliance, 1000 Ω at 20 mA

**Output Calibration**

Multi-turn zero and span potentiometers for each output channel ±15% of span adjustment range typical

**Output Characteristics**

- Linearity: ±0.1% of span
- Temperature stability: Better than 0.04%/°C typical
- Output ripple and noise: Less than 10 mVrms

**Isolation**

Full 5-way, 1200 Vrms minimum

**Response Time**

Channel 1: 70 milliseconds nominal

**Output Loop Power Supplies**

20 VDC nominal, regulated, 25 mA for each output channel
May be selectively wired for sinking or sourcing mA output

**Output Test**

Front buttons set each output to test level when pressed
Each test level potentiometer adjustable 0-100% of span

**Installation Environment**

Mount vertically to a 35 mm DIN rail
For use in Pollution Degree 2 Environment
IP 40 housing, requires installation inside an enclosure
-10°C to +60°C operating ambient

**Connectors**

Eight 4-terminal removable connectors, 14 AWG max wire size

**Power**

- 85-265 VAC, 60-300 VDC, 6 W maximum
- D versions: 9-30 VDC or 10-32 VAC

---

**APD 2007**

**APD 2007 D**

- DuoPak 2 channel DC-DC, Freq.-DC converter/isolator/transmitter
- Universal Power
- 85-265 VAC, 50/60 Hz or 60-300 VDC
- 9-30 VDC or 10-32 VAC

**LoopTracker**

API exclusive features include four LoopTracker LEDs (green for each input, red for each output) that vary in intensity with changes in the process input and output signals.

These provide a quick visual picture of your process loop at all times and can greatly aid in saving time during initial startup and troubleshooting.

**Output Test**

An API exclusive feature includes output test buttons for each channel to provide a fixed output (independent of the input) when held depressed.

Terminals are also provided to operate the test functions remotely for each channel. This also allows use as a remote manual override to provide a temporary fixed output if desired.

The test output level for each channel is potentiometer adjustable from 0 to 100% of the output span. The output test greatly aids in saving time during initial startup and/or troubleshooting.

**How to Order**

Models are factory ranged. See I/O ranges above left. Ranges and options for each channel must be specified on order

**Options and Accessories**

Options—add to end of model number

- Channel 1 I/O reversal (i.e. 20-4 mA out)
- Channel 2 I/O reversal (i.e. 20-4 mA out)
- Channel 1 and channel 2 I/O reversal
- Channel 1 high voltage output >10 V up to 20 V
- Channel 2 high voltage output >10 V up to 20 V
- Channel 1 and channel 2 high voltage output

U Conformal coating for moisture resistance

Accessory—order as separate line item

API BP4 Spare removable 4 terminal plug, black

---

**Dimensions**

1.78” W x 4.62” H x 4.81” D
45 mm W x 117 mm H x 122 mm D

Height includes connectors

Precautions

WARNING! All wiring must be performed by a qualified electrician or instrumentation engineer. See diagram for terminal designations and wiring examples. Consult factory for assistance.

WARNING! Avoid shock hazards! Turn signal input, output, and power off before connecting or disconnecting wiring, or removing or installing module.

Précautions

ATTENTION! Tout le câblage doit être effectué par un électricien ou ingénieur en instrumentation qualifié. Voir le diagramme pour désignations des bornes et des exemples de câblage. Consulter l’usine pour assistance.

ATTENTION! Éviter les risques de choc! Fermez le signal d’entrée, le signal de sortie et l’élimination électrique avant de connecter ou de déconnecter le câblage, ou de retirer ou d’installer le module.

API maintains a constant effort to upgrade and improve its products. Specifications are subject to change without notice. See api-usa.com for latest product information. Consult factory for your specific requirements.

Electrical Connections

Polarity must be observed for signal wiring connections. If the input and/or output do not function, check wiring and polarity.

Each product is factory configured to your exact input and output ranges as indicated on the serial number label.

Outputs

For milliamp ranges determine if your devices provide power to the current loop or if the loop must be powered by the APD module. Typical voltage may be 9-24 VDC at your device’s terminals if it provides power to the loop.

Input 1, DC

For milliamp ranges determine if your devices provide power to the current loop or if the loop must be powered by the APD module. Typical voltage may be 9-24 VDC at your device’s terminals if it provides power to the loop.

<td>+ (5 V)</td>
</tr>
</tbody>
</table>

Input 2, Frequency

The input range is pre-configured at the factory and no calibration is needed. The frequency input is compatible with most types of sensors that produce a minimum 100 mV amplitude change and a minimum 5 microsecond pulse width. A 15 VDC supply is available to power the sensor if required. Refer to the sensor manufacturer’s data sheet to determine supply voltage and wiring requirements.

Sensor Load

The frequency signal input is capacitively coupled to prevent any DC in the input. Some sensors, typically those without an internal load resistor, require a resistive load in order to function.

The resistor value may be specified by the sensor manufacturer as the “minimum resistive load” or calculated from the sensor manufacturer’s specified “load current range”.

The 15 VDC power supply is capable of providing 25 mA. A load current range of 3 mA to 25 mA would typically use a 5 kΩ to 500 Ω resistor.

Module Power Terminals

Check model/serial number label for module operating voltage to make sure it matches available power. The power supplies are fuse protected and the unit may be returned to API for fuse replacement.

When using DC power, either polarity is acceptable, but for consistency, wire positive (+) to terminal 25 and negative (−) to terminal 29.

Mounting to a DIN Rail

Install module vertically on a 35 mm DIN rail in a protective enclosure away from heat sources. Do not block air flow. Allow 1" (25 mm) above and below housing vents for air circulation.

1. Tilt front of module down and position the lower spring clips against the bottom edge of DIN rail.
2. Push front of module upward until upper mount snaps into place.

Removal

Avoid shock hazards! Turn signal input, output, and power off.

1. Push up on bottom back of module.
2. Tilt front of module downward to release upper mount from top edge of DIN rail.
3. The module can now be removed from the DIN rail.

Calibration

Input and output ranges are factory pre-configured (at 24°C ±1°C).

Front-mounted Zero and Span potentiometers for each channel can be used to compensate for load and load variations.

1. Apply power to the module and allow a minimum 30 minute warm up time.
2. Using an accurate calibration source, provide an input to the module equal to the minimum input required for the application.
3. Using an accurate measurement device for the output, adjust the Zero potentiometer for the exact minimum output desired. The Zero control should only be adjusted when the input signal is at its minimum. This will produce the corresponding minimum output signal. For example: 4 mA for a 4-20 mA output or –10 V for a ±10 V output.
4. Set the input at maximum, and then adjust the Span pot for the exact maximum output desired. The Span control should only be adjusted when the input signal is at its maximum. This will produce the corresponding maximum output signal. Example: for 4-20 mA output, set the Span control to 20 mA.
5. Repeat adjustments for both output channels for max. accuracy.

Ch. 1 Sensitivity Adjustment

This multi-turn potentiometer provides an adjustable threshold level that the incoming signal must overcome before an output can be produced. This is used to limit noise and minimize false input signals that may cause erroneous readings.

Fully clockwise: (max. sensitivity), input threshold is ±25 mV.

Fully counterclockwise: (min. sensitivity), input threshold is ±25 volts.

Output Test Function

When the Test button is depressed it will drive the output with a known good signal that can be used as a diagnostic aid during initial start-up or troubleshooting. When released, the output will return to normal.

Each Test Cal. potentiometer is factory set to approximately 50% output. Each can be adjusted to set the test output from 0 to 100% of the output span. Press and hold the Test button and adjust the corresponding Test Cal. potentiometer for the desired output level. They may optionally be externally wired for remote test operation or a manual override. See wiring diagram at right.

Operation

The APD 2007 accepts one DC voltage or current input and one frequency input and provides two optically isolated DC voltage or current outputs that are linearly related to the inputs.

Green LoopTracker® input LEDS provide a visual indication that each signal is being sensed by the input circuitry of the module. They also indicates the input signal strength by changing in intensity as the process changes.

If an LED fails to illuminate, or fails to change in intensity as the process changes, check the module power or signal input wiring. Note that it may be difficult to see the LEDs under bright lighting conditions.

Two red LoopTracker output LEDS provide a visual indication that the output signals are functioning. They become brighter as the input and corresponding output change from minimum to maximum. For a current output the red LED will only light if the output loop current path is complete. For either current or voltage outputs, failure to illuminate or a failure to change in intensity as the process changes may indicate a problem with the module power or signal output wiring.

To avoid damage to the module, do not make any connections to unused terminals.
