**DC to DC Transmitters, Isolated**

**Input:** 0-10 mV to 0-500 VDC, ±10 mV to ±10 VDC, 0-100 µA to 0-900 mA DC

**Output:** 0-1 V to ±10 VDC or 0-1 mA to 4-20 mA

- Factory Set Custom I/O Ranges
- Easy-to-Install Plug-In Design
- Full 2000 V Input/Output/Power Isolation
- Input and Output LoopTracker-LEDs
- Output Test Button
- Built-In Loop Power Supplies for Input and Output

**Applications**
- Convert, Boost, Rescale Process Signals
- Isolate Single-Ended (Common Ground) PLC Inputs
- Interface Signals with Panel Meters, PLCs, Recorders, Data Acquisition, DCS, and SCADA Systems

**DC Input Range**
Factory configured, please specify input range or consult factory. See table on other side for common ranges.

- **API 4300 G Input Range**
  - Voltage: 0-100 mVDC to 0-500 VDC*
  - Bipolar voltage: ±100 mVDC to ±10 VDC
  - Current: 0-1 mA DC to 0-900 mA DC
  - *150 VDC max. for UL

- **API 4310 G Low Input Range Version**
  - Voltage: 0-10 mVDC to 0-100 mVDC
  - Bipolar voltage: ±10 mVDC to ±100 mVDC
  - Current: 0-100 µA DC to 0-1 mA DC

**Input Impedance (Voltage)**
200 kΩ minimum

**Input Voltage Burden (Current)**
1.25 VDC maximum

**Common Mode Rejection**
120 dB minimum

**Input Loop Power Supply**
18 VDC nom., unregulated, 25 mA DC, max. ripple, <1.5 Vp-p
May be selectively wired for sinking or sourcing mA input

**LoopTracker**
Variable brightness LEDs indicate I/O loop level and status

**DC Output Range**
Factory configured, specify output range

- Voltage, 10 mA max.: 0-1 VDC to 0-10 VDC
- Bipolar voltage: ±1 VDC to ±10 VDC
- Current: 0-1 mA DC to 0-20 mA DC
- 20 V compliance, 1000 Ω at 20 mA

**Output Calibration**
Multi-turn zero & span potentiometers, ±15% span adj. typ.

**Output Loop Power Supply**
20 VDC nominal, regulated, 25 mA DC, max. ripple <10 mVrms
Order EXTSUP option for unpowered mA output

**Output Test**
Sets output to test level when pressed. Test level factory set to approx. 50% of span. Specify custom setting.

**Output Ripple and Noise**
Less than 10 mVrms

**Linearity**
Better than ±0.1% of span

**Ambient Temperature Range and Stability**
−10°C to +60°C operating ambient
Better than ±0.04% of span per °C stability

**Response Time**
70 milliseconds typical, faster response times are available
DF option: 1 millisecond response time

**Isolation**
2000 VDCs minimum
Full isolation: power to input, power to output, input to output

**Installation Environment**
IP 40, requires installation in panel or enclosure
Use with API 008 or API 008 FS socket
Socket mounts to 35 mm DIN rail or can be surface mounted
UL 508C pollution degree 2 environments or better

**Power**
Standard: 115 VAC ±10%, 50/60 Hz, 2.5 W max.
P option: 85-265 VAC, 60-300 VDC, 2.5 W
A230 option: 230 VAC ±10%, 50/60 Hz, 2.5 W max.
D option: 9-30 VDC, 2.5 W typical

**Description**
The API 4300 G and API 4310 G are factory configured to accept a DC voltage or current input and provide an optically isolated DC voltage or current output that is linearly related to the input.

The API 4310 G utilizes an ultra-stable input amplifier for reliable operation with input signals as low as 10 mVDC.

Typical applications include signal isolation, conversion, boosting or a combination of the three. Full 3-way isolation (input, output, power) makes this module useful for ground loop elimination, common mode signal rejection or noise pickup reduction.

When a milliamp input is specified, a loop excitation power supply is included that may be wired for sourcing or sinking to allow you to use a powered or passive input device.

When a milliamp output is ordered, it provides power to the output current loop (sourcing). If an unpowered (sinking) current output is required, order the EXTSUP option for an open collector output.

Common ranges as well as custom ranges are possible. Consult the factory for assistance with special ranges.

Installation and Setup

Precautions
WARNING! All wiring must be performed by a qualified electrician or instrumentation engineer. See diagram for terminal designations and wiring examples. Consult factory for assistance.
WARNING! Avoid shock hazards! Turn signal input, output, and power off before connecting or disconnecting wiring, or removing or installing module.

Precautions
ATTENTION! Tout le câblage doit être effectué par un électricien ou ingénieur en instrumentation qualifié. Voir le diagramme pour désignations des bornes et des exemples de câblage. Consultez l’usine pour assistance.
ATTENTION! Éviter les risques de choc! Fermez le signal d’entrée, le signal de sortie et l’alimentation électrique avant de connecter ou de déconnecter le câblage, ou de retirer ou d’installer le module.

API maintains a constant effort to upgrade and improve its products. Specifications are subject to change without notice. See api-usa.com for latest product information. Consult factory for your specific requirements.

WARNING: This product can expose you to chemicals including lead and nickel, which are known to the State of California to cause cancer or birth defects or other reproductive harm. For more information go to www.P65Warnings.ca.gov

Socket and Mounting
Install module in a protective panel or enclosure. Allow space around module for air flow. Use API 008 or API 008 FS socket. See specifications for maximum allowable socket voltages. The socket clips to a standard 35 mm DIN rail or can be mounted to a flat surface.

Ranges
API 4300 G and API 4310 G input and output ranges are set at the factory and must be specified when ordered. Listed below are commonly ordered input and output ranges. Consult factory for other available ranges or special ranges. See the model/serial number label for module information, including power requirements, options, and I/O range information.

When a current output is ordered, it provides power to the output current loop (sourcing). Models with an unsourced (sinking) current output will have EXTSUP as part of the model number.

Signal Input

Polarity must be observed when connecting the signal input. If your transmitter has a current output, determine if it provides power to the current loop or if it must be powered by the API module. Use a multi-meter to check for voltage at the transmitter output terminals. Typical voltage may be in the range of 9 to 24 VDC. In this case, wire the device to terminals 6 and 5.

A passive input device can be powered by the 10 volt DC power supply at terminal 4. This may save the expense of purchasing a separate power supply for the input device. A typical example is shown, however consult the instructions for your specific sensor to determine its compatibility and proper wiring.

Type of Input Device | Terminal | Terminal |

<tr>
<td>Typically a 3 or 4-wire device.</td>
<td>6 (-)</td>
<td>5 (+)</td>
</tr>
<tr>
<td>Transmitter with unpowered mA (current) output. Typically a 2-wire device.</td>
<td>5 (-)</td>
<td>4 (+18 VDC)</td>
</tr>
</tbody>
</table>

Signal Output

Polarity must be observed for output wiring connections. If the output does not function, check wiring and polarity.

Note that with a current output the module provides power to the output loop unless option EXTSUP was ordered for a sinking output.

See table for terminal designations.

Device Connected to Output | Terminal | Terminal |

Module Power

Check model/serial number label for module operating voltage to make sure it matches available power.

AC power is connected to terminals 1 and 3. For DC powered modules (D option), polarity MUST be observed. Positive (+) is wired to terminal 1 and negative (–) is wired to terminal 3.

Calibration

Input and output ranges as specified on your order are factory pre-configured (at 24°C ±1°C). Top-mounted, Zero and Span potentiometers can be used to calibrate the output to compensate for load and lead variations.
1. Apply power to the module and allow a minimum 20 minute warm up time.
2. Using an accurate calibration source, provide an input to the module equal to the minimum input required for the application.
3. Using an accurate measurement device for the output, adjust the Zero potentiometer for the exact minimum output desired. The Zero control should only be adjusted when the input signal is at its minimum. This will produce the corresponding minimum output signal. For example: 4 mA for a 4-20 mA output or –10 V for a ±10V output.
4. Next, set the input at maximum, then adjust the Span potentiometer for the exact maximum output desired. The Span control should only be adjusted when the input signal is at its maximum. This will produce the corresponding maximum output signal. Example: for 4-20 mA output, the Span control will provide adjustment for the 20 mA or high end of the signal.
5. Repeat adjustments for maximum accuracy.

Output Test Function

The test button may be used to drive the device on the output (a panel meter, chart recorder, etc.) with a known good signal that can be used as a system diagnostic aid during initial setup or during troubleshooting.
When depressed it will drive the output with a known good signal. When released, the output will return to normal.
The single-turn Output Test potentiometer is factory adjusted to approximately 50% of the output span. For a bipolar output it is set to approximately 50% of the positive output. It can be field adjusted if required.
The potentiometer access hole is covered with a label. It is adjustable from 0 to approximately 80% of the positive output span. Press and hold the Test button and adjust the potentiometer for the desired output level. When released, the output will return to normal.

Operation

The API 4300 G and API 4310 G are factory configured to your exact input and output requirements. The input is filtered, either amplified or attenuated as required, then passed through to the output stage.
The green LoopTracker* input LED provides a visual indication that a signal is being sensed by the input circuitry of the module. It also indicates the input signal strength by changing in intensity as the process changes from minimum to maximum.
If the LED fails to illuminate, or fails to change in intensity as the process changes, check the module power or signal input wiring. Note that it may be difficult to see the LEDs under bright lighting conditions.
The red LoopTracker output LED provides a visual indication that the output signal is functioning. It becomes brighter as the input and the corresponding output change from minimum to maximum.
For current outputs, the red LED will only light if the output loop current path is complete. For either current or voltage outputs, failure to illuminate or a failure to change in intensity as the process changes may indicate a problem with the module power or signal output wiring.

Battery

With EXTSUP option only.

Sourcing mA input

Voltage or sinking input

Passive mA Signal

Sourcing mA input

Voltage or Powered mA Signal

Module Power

For a mA output the API module provides 20 V to power the loop.

To maintain full isolation avoid combining power supplies in common with input, output, or unit power.

Sourcing mA output

Voltage signal output

With the EXTSUP option the module mA output does not provide power to the loop.

EXTSUP option, sinking mA output

Powered mA Device

Power Source

For AC or DC (-)

Module power

AC or DC (+)

Terminals 4 and 5 provide 18 V loop power for a passive mA input

Terminals 5 and 6 are used when the mA input device provides loop power.
